Julie Frew, course director for SBM 204 Psychiatry, would like to propose a small change to an SBM Psychiatry course objective. The change is:

**OLD** 5. Describe the signs and symptoms of *Cognitive Disorders and related conditions* along with current knowledge of risk factors, pathophysiology, and management strategies including both pharmacologic and nonpharmacologic treatments

**NEW** 5. Describe the signs and symptoms of *Neurodevelopmental and Neurocognitive Disorders* along with current knowledge of risk factors, pathophysiology, and management strategies including both pharmacologic and nonpharmacologic treatments

Rationale: This is the way the new DSM-5 classifies these disorders, and it allows SBM Psychiatry to describe the Autism Spectrum Disorders session more precisely (it is categorized as a Neurodevelopmental Disorder in DSM5).
